

GetJust.ai Marketing Outcomes Analysis

Executive summary

GetJust.ai, whose platform is branded **JustAI** and whose earlier product identity was **Just Words**, positions itself as an AI-first lifecycle marketing system built around always-on agents for strategy, creative generation, decisioning, and analytics. In public materials, the company describes the platform as an overlay for an existing marketing stack rather than a wholesale rip-and-replace: its homepage says “Bring your tools, add a brain,” its privacy statement centers on inbound event data from external systems, and multiple customer stories emphasize going live quickly without heavy engineering. The company rebranded to JustAI in October 2025 and says the broader platform lets “intelligent agents think, create, optimize, and measure in sync.” ¹

The public “recipe” behind JustAI’s marketing impact is unusually explicit for an early-stage vendor. The system combines a **Strategy Agent** that predicts cohorts and high-leverage moments, a **Creative Agent** that generates brand-safe HTML content from brand voice and product knowledge, a **Decisioning Agent** that reallocates traffic in real time, a **Data Agent** that turns event streams into insights, and a **Compass** layer that recommends the next lifecycle action. Under the hood, JustAI says it uses **reinforcement learning**, specifically **Weighted Thompson Sampling** for non-contextual optimization and **Disjoint Linear Thompson Sampling** for contextual optimization, plus an LLM-based “Auto-Tune” loop that generates new variants from live performance patterns. Public technical disclosures also claim **sub-100ms decision latency**, support for **millions of daily decisions**, and a modular architecture. ²

The outcomes JustAI publishes are strongest in **lifecycle marketing**, **creative optimization**, **conversion-oriented messaging**, and **campaign automation** rather than in top-of-funnel ad buying or formal attribution. Public case studies report results such as **\$160,000 incremental revenue in three weeks at Coursera**, **+33% and +24% purchase lifts at Outschool**, **a +96% CTR increase and \$1.34M annualized revenue impact at Notion**, **a +4.7% aggregate open-rate lift at Tumblr**, **+16% email engagement and +7% premium subscriptions at Grammarly**, and **up to +80% CTR / +35% OR at Thumbtack** before the work shifted toward deeper revenue validation. These numbers suggest the platform is best suited to situations where firms already have meaningful first-party event data and repeated message opportunities, and where the main bottleneck is learning speed rather than channel access. ³

The main limitations in public documentation are just as important. **List pricing is not published**. The **base LLM provider and model names are not disclosed**. Public materials describe online learning and prompt-based content generation, but do **not** disclose classical supervised fine-tuning pipelines, exact attribution methodology, or detailed SDK/API references. The privacy statement is stronger than average for a young vendor, however: it says PII is not stored or used in analytics, ranking, generation, or ML systems; that identifiers may be used only in **strictly opt-in** joins across client systems; and that customers can use scrubbed webhooks or S3 exports to reduce PII exposure. ⁴

My analytical conclusion is that marketers should think about JustAI less as “another ESP” and more as an **optimization and decisioning layer** that sits on top of existing lifecycle operations. The best replication

path is a phased rollout that starts with one revenue-linked lifecycle journey, keeps a persistent control group, feeds JustAI pseudonymous event data plus brand and compliance rules, and lets the system optimize content, cohorting, and cadence while humans govern success metrics and guardrails. That is the path most consistent with the company’s own technical disclosures and case-study evidence. ⁵

Company overview and product modules

JustAI is the product and commercial identity behind the **getjust.ai** domain. Its public materials show the company evolved from **Just Words**, a narrower creative-personalization product, into a broader “end-to-end marketing platform.” Official sources identify the legal entity as **Choice AI Inc.**; the company says it raised **\$1.7 million** in seed financing led by **Peak XV Partners** and **Y Combinator**; and external company profiles list founders **Neha Mittal** and **Jeff Hara**, with 2024 as the founding year. YC describes the company as an AI-first enterprise marketing stack, while Peak XV describes it as an AI-powered lifecycle marketing platform whose autonomous agents handle strategy, content creation, decisioning, and analysis. ⁶

A practical way to understand the product is to map the public modules to the marketing jobs they perform.

Module	Public description	What it means in practice	Evidence
Strategy Agent	Predicts cohorts autonomously and uncovers patterns between converters and non-converters, surfacing untapped segments and high-leverage moments.	Audience discovery, segmentation, and hypothesis generation.	⁷
Creative Agent	Blends brand voice, tone, user insights, blogs, and product knowledge to generate conversion-ready HTML content.	Variant generation, message block creation, localization-ready creative production.	⁸
Decisioning Agent	Runs real-time optimizations across channels, identifies winning variants, and routes more traffic to what performs best.	Bandit-style traffic allocation and continuous optimization.	⁹
Data Agent	Turns billions of data points into actionable insights and generates insights autonomously.	Performance analytics, cohort-level learnings, next-best-action support.	¹⁰
Compass	Recommends the next best lifecycle action based on campaigns, performance, and learnings.	Workflow guidance, journey planning, orchestration recommendations.	¹¹

The homepage also exposes the platform’s feature surface more clearly than the brand copy alone suggests. Publicly visible use cases include **testing at scale** across content, cadence, and frequency; **localization** with market-specific language, pricing, and context; **cohort prediction**; **smart orchestration** of timing and frequency; and **AI-powered insights** on which segments and content patterns work. In the orchestration example shown on the homepage, Compass recommends a journey containing **3 emails, 1**

SMS, and 1 push, which is stronger evidence for multi-channel planning than the case studies alone, even though the published customer stories lean heavily toward email and push. ¹²

One useful inference from the official site is that JustAI wants to live **inside a marketer’s existing operating model**, not only as an idea generator. The company repeatedly emphasizes “always-on” optimization, real-time learning, and integrated reporting, while customer quotes stress less manual setup, lower analytics overhead, and much faster experimentation. That positioning matters when evaluating it against incumbents: JustAI’s public strength is not breadth of martech categories, but compression of the experimentation loop inside lifecycle programs. ¹³

Technical architecture and AI methods

Public technical documentation indicates a layered architecture: **event ingestion and identity-safe joining, cohort and context modeling, creative generation, decisioning/routing**, and **measurement/insights**. The strongest published inputs include pseudonymous identifiers, send/open/click/conversion event metadata, timestamps, user attributes, lifecycle stage, device, time of day, and campaign context. The system can also ingest brand voice, campaign goals, compliance rules, product knowledge, blogs, and past winning content patterns for the creative loop. ¹⁴

The company’s reinforcement-learning writeup is detailed enough to reconstruct the core decision logic.

Layer	Publicly disclosed method	Inputs	Outputs	What is unspecified
Global optimization	Weighted Thompson Sampling using Beta distributions, multi-metric weighting, bias correction, and neutral priors.	Opens, CTR, downstream conversions, campaign baselines.	Global winner selection and weighted routing.	Exact business-weight defaults and confidence thresholds. ¹⁵
Contextual optimization	Disjoint Linear Thompson Sampling , with per-variant linear models and Bayesian posterior sampling.	High-dimensional feature vectors such as user type, lifecycle stage, device, and time of day.	User-level best-variant selection.	Feature engineering schema, regularization details, and model retraining cadence. ¹⁵
Content generation	LLM-driven Auto-Tune with structured prompts and guardrails.	Brand voice, compliance rules, campaign goals, live winning patterns from RL.	New on-brand variants for exploration.	Base model vendor, model names, temperature controls, and any fine-tuning pipeline. ¹⁶

Layer	Publicly disclosed method	Inputs	Outputs	What is unspecified
Measurement	Real-time reporting, automated insights, and claimed “true causal lift measurement in production.”	Event telemetry and campaign outcomes.	Readouts, learnings, pattern detection, routing feedback.	Exact attribution model, counterfactual framework, or incrementality methodology. ¹⁷
Privacy and joining	Webhooks, shared storage, opt-in identifier joining across client systems.	Customer.io webhooks, S3 exports, Segment/Iterable joins, similar automated feeds.	Event streams and correlated records for performance analysis.	Public API schemas, SDK lists, warehouse-native modes, and retention windows for non-PII. ¹⁸

The most important architectural insight is that **JustAI is not publicizing classical offline supervised model training as its core moat**. Instead, the public emphasis is on **online learning**: Bayesian bandits update from observed outcomes, while the LLM generation loop is steered by live performance feedback. That suggests the “training” story is primarily **inference-time adaptation plus continuous posterior updating**, not heavy custom fine-tuning. Because the company never names base models or describes supervised fine-tunes in public technical material, the most rigorous description is: **model-provider unspecified; online RL and prompt-governed LLM generation clearly specified**. ¹⁵

The same materials also reveal enough about integrations to shape an implementation view. The privacy statement explicitly mentions inputs via **webhooks**, **Customer.io**, **Amazon S3**, and optional joins across **Segment** and **Iterable**. A blog index also notes a public **Iterable partnership**. That combination, plus the “bring your tools” positioning, strongly supports the interpretation that JustAI plugs into an existing CDP/ESP/CRM stack and consumes event and campaign data rather than demanding a greenfield deployment.

¹⁹

Marketing use cases and measurable outcomes

The public use-case footprint is broadest in **lifecycle and retention marketing**. The system is clearly shown supporting onboarding, activation, churn reduction, post-cancellation winback, purchase conversion, notification optimization, localization, segment prediction, and cadence/timing orchestration. Public evidence for classic top-of-funnel paid media buying, web recommendation serving, or enterprise MMM is much weaker. In other words, JustAI’s published sweet spot is **high-frequency owned-channel optimization**. ²⁰

Use-case coverage

Marketing use case	Public support level	What the sources show	Evidence
Lead nurture and lead-to-conversion	Strong	Lemonade optimized new-lead and cross-sell campaigns for qualified renters-insurance requests.	21
Onboarding and activation	Strong	ClickUp optimized early activation behaviors such as view creation and task creation.	22
Personalization and cohorting	Strong	Strategy Agent predicts cohorts; Outschool and ClickUp used dynamic cohort-level learning across many dimensions.	23
Creative optimization	Strong	Tumblr, Grammarly, Thumbtack, and Notion all center on large-scale message variation and winner selection.	24
Cadence and send-time optimization	Strong	Outschool tested day-pairs, timing, and sequence length as part of the same decision surface.	25
Localization	Moderate-to-strong	Homepage explicitly promotes localization; Photroom quote cites copy optimization and localization help.	26
Campaign automation and orchestration	Strong	Compass recommends next best actions; homepage shows multi-message journeys; case studies describe one unified AI-decisioning setup.	27
Attribution and incrementality	Partial	JustAI claims causal lift measurement and multi-metric scoring, but exact attribution methodology is unspecified.	15

Published outcomes and KPIs

Customer	Use case	Published KPI impact	Operational impact	Evidence
Coursera	Lifecycle email optimization	\$160,000 incremental revenue in 3 weeks; +16.25% enroll-course rate in welcome/onboarding; +27% subscription rate in churn series; +5.14% subscription rate post-cancellation.	147 variants in one month, 452,000+ messages, 65 AI decisions , setup in under 2 weeks , more than 4,000 hours saved annually .	28

Customer	Use case	Published KPI impact	Operational impact	Evidence
Outschool	Multi-agent lifecycle decisioning	+33% lift in purchase membership rate on Email 1; +24% lift in purchase rate on Email 2; +110 incremental conversions in under 2 weeks; a new topic produced 2x click rates and +20% membership conversion lift.	307 variants, 100+ AI decisions, 4M lifecycle messages , equivalent of 12 years of one-off A/B testing compressed into weeks.	29
ClickUp	Activation personalization across 300+ segments	Within weeks: +89% create-view rate, +37% create-view rate on dashboards, +26% click rate, +20% create-task rate, +19% create-view rate for admins/owners, +12% view rate on short CTA.	Replaced manual segment-rule complexity with dynamic cohort traffic distribution.	30
Tumblr	Push notification optimization	Aggregate +4.7% open-rate lift across five notification types; per-campaign launch-rate lifts from +23.11% to +33.89% on four of five campaigns.	Champion variants emerged in under two weeks ; editorial team tested 10x more copy variations.	31
Grammarly	Email engagement and subscriptions	16%+ lift in email engagement and 7% lift in premium subscriptions.	45+ variants tested in two months using continuous AI testing.	32
Notion	Monetization and content variation	One campaign delivered +96% CTR and \$1.34M annual revenue impact.	Platform ran 100+ content variations.	33
BiggerPockets	Email engagement and premium conversion	32% gain in email engagement and 44% gains in premium conversions.	Framed as tailored messaging plus automation and ML.	33
Thumbtack	Push creative optimization	Early results showed up to +80% CTR and +35% OR , after which the work shifted toward requests and revenue rather than vanity metrics.	Generated learnings about regret, weak tests, and revenue-linked optimization.	34

These public results are impressive, but marketers should interpret them with care. The company publishes strong **lift metrics**, **experimentation velocity metrics**, and some **revenue impact metrics**, yet it does **not** publish standardized customer-level data on **CAC reduction**, **LTV uplift**, **payback period**, or **cross-customer ROI distributions**. That does not negate the published wins, but it means procurement and analytics teams should validate those economics in-house rather than assume them. ³⁵

Adoption recipe and implementation roadmap

The most reliable implementation approach is to copy the logic visible in the best case studies, while tightening the measurement and governance discipline around it.

Step-by-step recipe

1. Choose one business outcome that actually pays the bills.

JustAI's best public examples improved fastest when the terminal KPI was concrete: qualified requests at Lemonade, purchase membership at Outschool, enrollments and resubscriptions at Coursera, or activation actions at ClickUp. Use opens and CTR only as early signals, not as the optimization objective for a revenue journey. Lemonade's public lessons are explicit on this point.

³⁶

2. Prepare a clean event spine before touching creative.

At minimum, provide pseudonymous user identifiers, campaign/message IDs, send/open/click/conversion events, timestamps, channel, and key contextual fields such as lifecycle stage, locale, device, and segment attributes. Those are the data categories most directly evidenced in JustAI's technical and privacy materials. If you want contextual decisioning to matter, supply the context. ³⁷

3. Integrate through your existing stack instead of rebuilding the stack.

The public deployment pattern is: wire in event feeds through webhooks or S3, optionally join records across systems such as Segment and Iterable, and let marketers operate the system with minimal engineering after setup. The official positioning and case studies strongly support an overlay model for ESP/CDP/CRM environments. ³⁸

4. Encode brand voice, product knowledge, and compliance rules up front.

The Creative Agent is only as good as the constraints it receives. The public docs say the LLM layer uses structured prompts with brand voice, compliance rules, and campaign goals, while the homepage says the Creative Agent also uses blogs and product knowledge. For regulated or high-risk verticals, this step should be treated as a pre-launch gate, not an afterthought. ¹⁶

5. Start with one or two journeys where message repetition is high.

Good first candidates are welcome/onboarding, trial-to-paid, churn rescue, post-cancellation, or push re-engagement. That is where JustAI's published evidence is deepest, and where repeated impression volume gives the bandit system enough feedback to learn quickly. ³⁹

6. Launch with bounded exploration and a persistent control.

Use a holdout or fixed-split control cell that stays human-authored and policy-stable. Inside the treatment arm, let JustAI rotate many variants and reallocate traffic dynamically. This setup

preserves a clean business readout while still letting the RL engine learn quickly. The company's own case studies repeatedly show that exploration is powerful but can create regret if unconstrained. ⁴⁰

7. Review weekly for insight, not just lift.

The real upside in JustAI's operating model is not only better immediate performance; it is reusable learning about which message frames work for which cohorts and when. Coursera, ClickUp, Outschool, and Tumblr all emphasize the value of learning density, not just one-off wins. Make weekly reviews answer three questions: what won, for whom, and should that insight be ported into other journeys. ⁴¹

8. Scale from creative to cadence to orchestration.

Outschool is the clearest proof that cadence can be optimized on the same surface as content, topic, and audience. Once the first journey shows stable lift, expand the decision space to timing, delays, sequence length, and cross-channel routing. The homepage's Compass example reinforces this progression from message optimization to journey orchestration. ⁴²

9. Keep privacy and compliance architecture explicit.

JustAI's privacy statement is favorable to enterprise buyers, but it does not remove the client's governance burden. Strip unnecessary PII where possible, use scrubbed webhook forwarding or S3 export when required, and turn on identifier joining only if it is truly needed and contractually approved. ¹⁸

What to prepare before deployment

Requirement	Minimum viable standard	Why it matters
Event data	Send/open/click/conversion events with timestamps and campaign/message IDs	Required for bandit feedback and measurement. ³⁷
User context	Lifecycle stage, cohort attributes, locale, device, product/customer traits	Required for contextual decisioning and hyper-segmentation. ⁴³
Creative knowledge	Brand voice, claims library, prohibited language, product docs/blogs	Required for on-brand generation and QA. ¹⁶
Data governance	Pseudonymous IDs by default; approved join keys only if needed	Reduces privacy risk and aligns with the vendor's stated model. ¹⁸
Team roles	Lifecycle/CRM owner, marketing ops, analytics lead, brand/legal reviewer, optional engineering/FDE support	Public evidence suggests low engineering needs after setup, but strong cross-functional governance still matters. ⁴⁴

The public evidence suggests a first pilot can move quickly. Coursera says JustAI took **one afternoon** to set up and was live **in under two weeks**, while Tumblr found champion variants in **under two weeks**. For a rigorous enterprise rollout, though, the safer recommendation is an **eight-to-twelve-week pilot** that includes data QA, review gates, and statistically interpretable control cells. ⁴⁵

Pricing and competitive landscape

Pricing and packaging

JustAI does **not** publish list pricing on the public pages reviewed. The commercial path appears demo-led, although a Coursera case study says several capabilities that would otherwise cost millions to build are “included in platform pricing.” That is useful positioning, but not a substitute for transparent packaging. By contrast, incumbents are mixed: Braze publishes pricing pages but not list rates, Iterable routes pricing through sales, Optimove describes flexible tailored pricing, and Customer.io publishes concrete entry plans.

46

Vendor	Public pricing availability	Public packaging notes	Evidence
JustAI	Unspecified	Demo-led; Coursera case says core decisioning, routing, dashboards, and LLM content are included in platform pricing.	47
Braze	No list rates published	Platform Editions plus value-based pricing; pricing page and free-trial entry points exist.	48
Iterable	Custom / sales estimate	Contact-sales flow advertises pricing estimates and integration guidance; billing references high-water-mark usage metrics.	49
Optimove	Tailored pricing	Flexible scalable pricing based on customer data volume, active profiles, and orchestration scope.	50
Customer.io	Public list pricing	Essentials starts at \$100/month for 5k profiles; Premium starts at \$1,000/month .	51

Comparative analysis

Platform	What it publicly emphasizes	Where it appears stronger than JustAI	Where JustAI appears differentiated	Best-fit buyer
JustAI	Explicit RL decisioning, agent workflow, localization, cohort prediction, next-best-action, rapid lifecycle experimentation.	Niche specialist rather than broad suite.	Publicly discloses more about bandits and agent roles than most rivals; strong proof in lifecycle/push/email optimization.	Teams with a real lifecycle program and strong first-party event data. 52

Platform	What it publicly emphasizes	Where it appears stronger than JustAI	Where JustAI appears differentiated	Best-fit buyer
Braze	Cross-channel engagement plus BrazeAI and Personalized Paths.	Broader enterprise engagement platform, mature ecosystem, broad channel support.	Public materials are less explicit than JustAI's about RL method and closed-loop LLM refresh.	Large enterprises standardizing on a full engagement platform. ⁵³
Iterable	AI customer engagement platform with real-time decisioning and unified data/action.	Broad enterprise engagement suite with strong operator tooling and support ecosystem.	Public evidence from JustAI is more specific on variant bandits and cohort-level experimentation compression.	Enterprises wanting AI on top of a mature campaign platform. ⁵⁴
Optimove	Positionless marketing, AI Decisioning Studio, AI content decisioning, multichannel engage.	Stronger public positioning around coordinated enterprise CRM decisioning and multichannel engagement.	JustAI publishes more granular case-study detail on experimentation speed and specific lift stories.	Mature CRM organizations seeking coordinated AI decisioning at scale. ⁵⁵
Blueshift	Built-in CDP, predictive + generative + agentic AI, campaign optimizer agent.	Stronger public story around unified profiles/ CDP plus AI in one system.	JustAI's public technical writeup is more explicit about optimization mechanics.	Teams wanting CDP + engagement + AI in one vendor. ⁵⁶
Customer.io	Data-driven journeys, APIs/webhooks, AI Agent, public pricing.	Lower barrier to entry, stronger public API and pricing transparency.	JustAI's public case studies show a more advanced decisioning-and-learning layer.	Cost-conscious teams that want flexible orchestration and open integrations. ⁵⁷

The strategic takeaway is straightforward. If the organization already has Braze, Iterable, Customer.io, or another engagement platform, JustAI looks most compelling as the **intelligence layer** that accelerates cohorting, creative generation, and traffic allocation on top of that core system. If, by contrast, the organization is shopping for a broad foundational engagement platform, the larger incumbents still look stronger on breadth, governance depth, and ecosystem maturity. That is not a criticism of JustAI; it reflects the different category it appears to be occupying. ⁵⁸

Risks, limitations, and validation plan

The biggest operational risk is **optimizing the wrong metric**. Lemonade’s case study is explicit that price-led lines and “clever” copy could improve opens while hurting purchase intent, and Thumbtack’s story shows how easy it is to celebrate CTR/OR wins before proving real business impact. Any JustAI deployment should therefore start with one terminal KPI per journey and treat engagement metrics as accelerants, not the prize. ⁵⁹

The second risk is **exploration regret**. Reinforcement learning is powerful because it explores, but its public case studies also show the cost of weak tests, immature learning windows, and over-dispersed traffic. JustAI itself says sparse-data campaigns use neutral priors and graceful degradation, yet buyers should still protect themselves with control cells, minimum sample requirements, and archive rules for underperformers. ⁴⁰

The third risk is **data and governance quality**. Contextual bandits only work if the input schema is meaningful. If lifecycle stage, locale, cohort labels, and conversion events are incomplete or noisy, the personalization layer will learn from the wrong signal. Privacy risk is also real: although the vendor says PII is not stored or used in ML systems, customers remain responsible for ensuring that the payloads they send are compliant with internal and legal requirements. ⁶⁰

The fourth risk is **vendor opacity** in a few critical areas. Public materials do not specify the base LLM provider, exact attribution framework, list pricing, or the detailed API/SDK surface. For a buyer, that means procurement and security review should explicitly ask for model-provider disclosure, latency and uptime SLAs, data retention details, permissioning model, logging/redaction behavior, and evidence of how “causal lift” is actually measured. Publicly, those details are still **unspecified**. ⁶¹

Recommended validation plan

The safest way to validate impact is a **hybrid experimentation design**: keep a fixed control arm for clean incrementality measurement, while allowing JustAI to use dynamic allocation within the treatment arm.

Test design	Goal	Recommended setup	Primary KPI	Guardrails
Incrementality holdout	Prove business lift vs. current process	10%–20% control on current creative/rules; 80%–90% treatment with JustAI variants and routing	Journey conversion or revenue per eligible user	Opens, CTR, unsubscribes, spam complaints
Contextual personalization test	Validate whether context-aware routing beats global winners	Run one treatment with simple global ranking and one with contextual bandit features turned on	Conversion lift by cohort and overall	Segment fairness, sparse-data controls

Test design	Goal	Recommended setup	Primary KPI	Guardrails
Creative Auto-Tune test	Validate whether generated variants improve over static human-authored pools	Seed with approved human variants, then allow controlled LLM generation under brand guardrails	Conversion or qualified click rate	Brand review failure rate, legal/compliance flags
Cadence optimization test	Prove timing/frequency adds lift beyond message copy	Fix creative family; let JustAI optimize day-pairs, delays, and second-send timing	Conversion per user contacted	Unsubscribes, fatigue, complaint rate
Long-horizon economics test	Estimate CAC, payback, and LTV impact	Hold back a stable ghost-control or geo/time-based control for at least one full retention/payback cycle	LTV:CAC, payback period, retained revenue	Seasonality adjustments, channel spillover

Those designs are directly aligned with the platform's public strengths. Weighted Thompson Sampling is best for globally stable campaigns; contextual bandits are best when outcomes vary by user type, device, time, or lifecycle stage; and the Auto-Tune loop is best when creative freshness is part of the problem. Public case studies also show that cadence and topic can be optimized on the same surface, so do not stop at subject lines if the first pilot works. ⁶²

A rigorous rollout should have the following acceptance thresholds before scale-up: statistically or economically meaningful lift on the journey's terminal KPI; no material deterioration in unsubscribe or complaint rates; stable model behavior across at least two learning cycles; and a clear governance process for creative guardrails, privacy reviews, and approval gates. If those conditions are met, the next expansion step should be **localization, cross-journey orchestration, and next-best-action planning** rather than simply creating more variants of the same email. That sequence is the closest match to the product's published operating model and customer evidence. ⁶³
